On the frequent cases of supplies from Turkey plant products infested by quarantine facilities for Russia

June 28, 2012

During the first half of this year during the Roselkhoznadzor state phytosanitary quarantine control of the regulated product received from Turkey, in 33 cases revealed two types of quarantine facilities for Russia - the American white moth and the western (California) flower thrips. Contaminated products are accompanied by a phytosanitary quarantine certificates issued by the Directorate General of Protection and Control Ministry of Food Agriculture and Livestock in Turkey, ensuring compliance with its international and domestic phytosanitary requirements.

Roselkhoznadzor appealed to the General Directorate of Protection and Control Ministry of Food Agriculture and Livestock Turkey to take urgent measures to ensure full compliance with Russian and international phytosanitary requirements for the regulated supply of Turkish goods to Russia. As you know, in 2005 Roselkhoznadzor was forced to introduce restrictive measures on imports of Turkish plant products due to the systematic discovery in her quarantine facilities in Russia. The situation with the Turkish side software security products exported to Russia is compounded by the fact that for the first half of this year in 41 batches of vegetable origin with a total mass of 750 tons, Roselkhoznadzor revealed a significant excess of the maximum permissible levels of pesticide residues, nitrates and nitrates, established by Russian legislation.
